| RULE OF THUMB	IS THIS RULE APPLIED? HOW SO?	IS THIS RULE VIOLATED? HOW SO?
1. Visibility of system status	Colour scheme has good contrast and clickable buttons are large in size	-
2. Match between system and real world	Pages are named with existing concepts like dashboard, discussions, repositories and messages.	-
3. User control and freedom	User make changes as and when they feel the need by either starting discussion threads or message threads. Users are able to change the privacy settings of their repositories	-
4. Consistency and standards	All pages use the same base format where the navigation sidebar is fixed and user profile icon is fixed. I have also ensure the same typography and colour scheme is followed throughout the application	-
5. Error prevention	I have provided an option for the user to either sign up or sign in and also a "forgot password" option on the sign in page	-
6. Recognition rather than recall	While using icons that may not be obvious to the user I have also typed out what the icon does. This is seen in the navigation sidebar where I have used icons to navigate between the four main pages and also provided a small caption below the icon to indicate which page it will lead to	-
7. Flexibility and efficiency of use	As there are dedicated pages for each functionality it makes the application easy to use and efficient as the user can complete their task with a few clicks.	-
8. Aesthetic and minimalistic design	I have used a colour palette with 5 colours and used simple rectangular shapes to distinguish different areas on screen.	-
9. Help user's recognise, diagnose and recover from errors	I have provided a forgot password option on the sign in page and also a help button on the user profile page.	-
10. Help and documentation	I have provided a help button on the user profile page which in the future can be linked to the help and documentation page.	-
